

# Lecture 14:

## Stack

# Today's Goals

- Learn how HCS12 stack functions

# What is the Stack?

## Last in, First out (LIFO)

- The stack is a last-in, first-out (LIFO) data structure.
- Two fundamental operations
  - Push: add to the top of the list
  - Pop/Pull: removes an item from the top of the list.
- Temporary variable storage
  - When subroutines are called.
- Think books stacked on a table
- c.f. Queue
  - First-in, first-out (FIFO) data structure

# The Stack

## Memory diagram of a stack

# Important Concepts about Stacks

- A regular RAM section will be used. No hardware enforces this boundary.
- Much like variable-length array
- The stack grows toward lower addresses when a value is added.
- SP (Stack Pointer register) holds the address of the current index of the stack.
  - SP moves up (decrements) when an item is added
  - SP moves down (increments) when an item is removed
  - Note: Addition/Removal happens after SP moves up/down
  - All bytes in the stack space that are located at addresses lower than SP are considered unused

# Important Concepts about Stacks

- Depth:
  - the number of bytes stored on the stack
- Empty:
  - If the depth is 0, we say the stack is empty.
- Underflow
  - Removing a byte from an empty stack
- Overflow
  - The depth is larger than the available stack space

# Manipulating the Stack and SP

## Adding/Removing an item to a stack

- PSHx
  - Push an item to the stack
  - X: A, B, C(CCR), D, X, Y
    1. S register is first decremented by the number of bytes to be pushed,
    2. then the value from the register is copied into the memory indicated by S.
- PULx
  - Pull or Pop an item from the stack
  - X: A, B, C(CCR), D, X, Y
  - One or two bytes (depends on the size of the register) at the top of the stack is/are copied into the specified register,
  - then S is incremented
- Note: PSHx and PULx (except for PULC) do not affect on CCR bits
- Again, there is no separate space for the stack. The stack is just a chunk of RAM. S register holds the current position.

# Manipulating the Stack and SP

- LDS
  - Load the stack pointer
  - Typically use only immediate addressing mode.
  - Typically initialize the pointer at the beginning of a program.
- LEAS
  - Remember LEAX and LEAY?
  - Load Effective Address into S register
  - This is useful to manipulate stack pointer without pushing/popping values.
  - With negative offsets, create space on the top of the stack
  - With positive offsets, removes data from the top of the stack

# Examples

## Example 1

1: LDS   #\$3600  
2: LDAA   #\$AA  
3: LDAB   #\$BB  
4: PSHA  
5: PSHB  
6: PULA  
7: PULB

After Line 1		After Line 4		After Line 5		After Line 6		After Line 7	
35FD	XX	35FD	XX	35FD	XX	35FD	XX	35FD	XX
35FE	XX	35FE	XX	35FE	BB	35FE	XX	35FE	XX
35FF	XX	35FF	AA	35FF	AA	35FF	AA	35FF	XX
3600	XX	3600	XX	3600	XX	3600	XX	3600	XX
SP	3600	SP	35FF	SP	35FE	SP	35FF	SP	3600

# Examples

## Example 2

1: LDS   #\$3600

2: LDAA  #\$AA

3: LDAB  #\$BB

4: PSHD

5: LDD   #\$CCDD

6: LEAS  2,SP

After Line 1		After Line 4		After Line 5		After Line 6	
35FD	XX	35FD	XX	35FD	XX	35FD	XX
35FE	XX	35FE	AA	35FE	AA	35FE	XX
35FF	XX	35FF	BB	35FF	BB	35FF	XX
3600	XX	3600	XX	3600	XX	3600	XX
SP	3600	SP	35FE	SP	35FE	SP	3600

Questions?

# Wrap-up

## What we've learned

- Stack
- PUSx, PULx, LDS, LEAS

# What to Come

- Subroutines
